The same action takes place underground in many cases, due principally to the escape of the electric current from electric railway circuits, the pipes in this case representing that metal in the battery which is attacked and destroyed. Generally the eletric current of the railway system is carried from the power station through heavy wires, and returns through the tracks. The latter are not insulated or protected in any way, and if the current finds an easier passage through some nearby pipe than through the rail, it will jump from the latter into the pipe, later on returning to the rail again. Whenever there are two paths for the current, it will divide between them, the greater part of the current taking the path which presents the least resistance. The points where rails come together...
